

Cybersurveillance for small organizations

An affordable first line of security

Cybercrime is not science fiction, but a real threat to public administrations. For smaller organizations with up to 15 employees, such as municipalities, cybersecurity specialist Hacknowledge offers a monitoring service for less than 10,000 francs.

Watchdog

It takes around 100 days on average for an organization to discover a breach or be notified of it. Watchdog aims to reduce this delay to a minimum, helping public authorities to take action and prevent hacking on their networks.

In practical terms, Watchdog uses a module connected to your IT infrastructure to monitor suspicious activity and report it to your IT security manager.

The advantages for you

- Service developed specifically for a team of 15 employees and an IT infrastructure of 40 devices (IP)
- 24/7 monitoring and automated reporting of security incidents
- Watchdog adapts to your existing IT infrastructure, so there's no need for additional investment
- 8 hours of professional service a year to answer your questions and provide advice
- Safety reports on request
- Swiss solution: all data is stored in Switzerland, the engineers work from Switzerland, no cross-border issues with confidential or personal data
- Hacknowledge is ISO 27001-certified and GDPR-compliant
- Vendor-neutral company: you are guaranteed to be supported by an independent service provider
- Additional services covering all aspects of cybersecurity are available: Security Operations Center (SOC), penetration testing, forensics and staff awareness

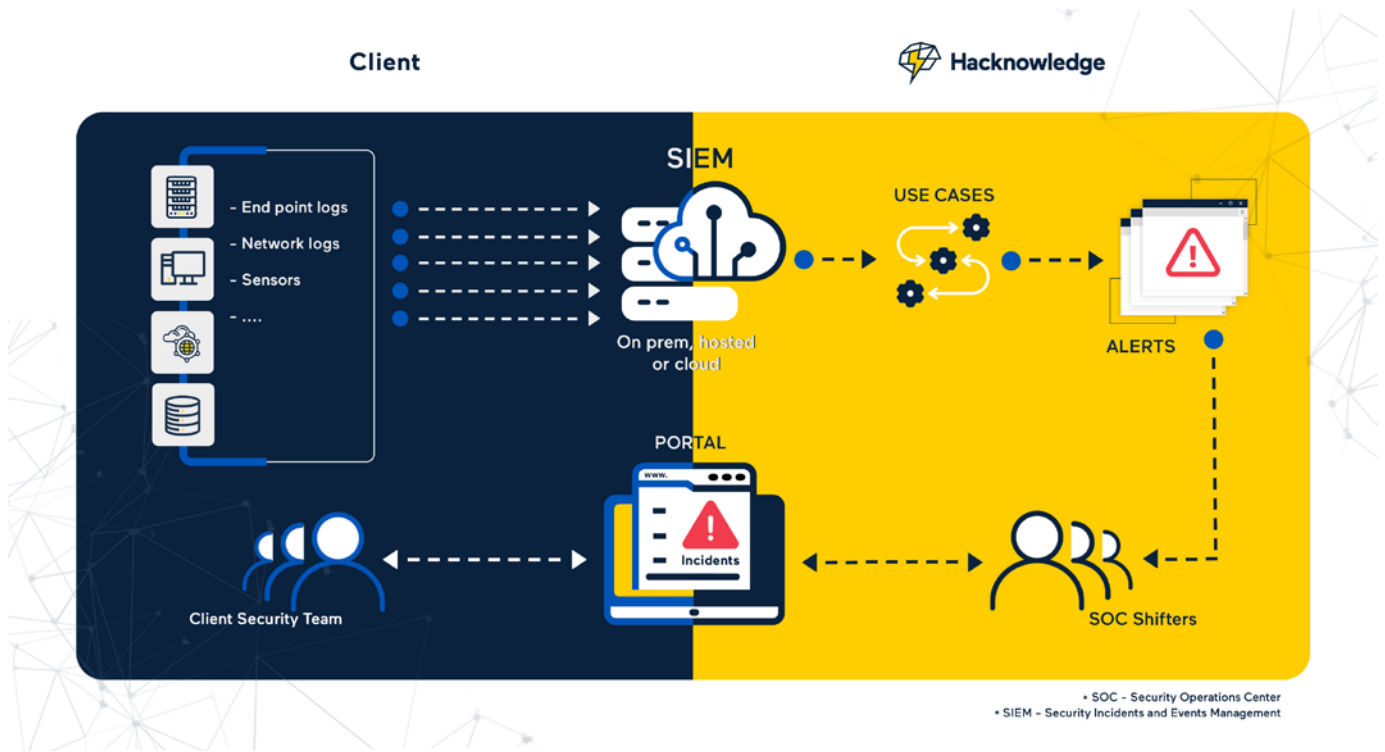

How Watchdog works

The Watchdog monitoring service operates via a module connected to your IT infrastructure. It monitors suspicious activity and reports incidents. The module, developed and optimized by Hacknowledge, can be physical or virtual. It adapts to the environment of any organization.

Watchdog includes:

- Intrusion detection system (IDS): a device or software that detects malicious events in an IT ecosystem
- Honeypots: deliberate flaws in a system used as traps to attract hackers and track their activities
- Vulnerability scanning: a program that searches for known vulnerabilities in an IT infrastructure

Services included in Watchdog

Watchdog comprises managed detection and response services (sandbox, honeypots, canaries, customer portal, dedicated sensors) and threat intelligence (continuous updates (daily+), private and commercial feeds). Other cybersecurity services can be provided in addition by Hacknowledge, depending on your administration's requirements.
